

ct-segmentation-toolkit

one installable, tested package · match the method to how many labels you actually have

segmentation of scientific image stacks, across the full supervision spectrum

SEGMENT — choose by label availability

The through-line: the honest first question is never *which architecture* but *how many labels do you have* — and there is a method here for every answer, from none to many. **Engineered as software:** pip-installable · tested on Python 3.10–3.12 · optional MLflow tracking · napari labeling · pyvista viewer.
